

A small, practical finance pilot built around you

A personal AI.EXE setup for one client in Canada, built by the developer in Nigeria. Your accounts and money stay in your name; AI.EXE becomes the research, explanation, and control layer.

What is already working

Money dashboard Income, expenses, reserves, goals, and the agreed client/developer split are already tracked locally.	Invoices and reports Draft invoices, monthly summaries, CSV exports, and a clear history of every change.
Mining pilot A real-results log plus an ASIC buy/no-buy calculator for payout, power, fees, and downtime.	No hidden money movement The current Finance section records and calculates. It does not connect to a bank or place trades yet.

Your idea, shaped into something buildable

- Ask AI.EXE to research Bitcoin and possible stocks, using current market and company information.
- A capable model such as Fable 5 turns that research into a simple trade proposal: what, why, amount, risk, and exit plan.
- Choose **Only once** to approve that trade, or later choose **Always trade** inside strict daily and per-trade limits.
- Every trade shows the reason. After it closes, AI.EXE explains the result and adds the lesson to its trade journal.
- Start with paper trading, then test the full real flow with a maximum of CAD \$10.

What Fable 5 adds

Real research Compare price action, news, filings, account limits, and the facts behind an idea.	Clear reasons Explain the opportunity and the downside in normal language before any action.	Useful memory Keep a trade journal, find patterns, and improve the rules instead of guessing.

About his computer

The Ryzen 7, 32 GB RAM, and RTX 5060 Ti 8 GB are a good home for AI.EXE, research tools, and lighter local models. It should be the control centre, not the Bitcoin miner. Real Bitcoin mining now needs dedicated ASIC hardware, so we leave mining hardware out of this first pilot.

The recommended path

Keep the idea ambitious, but make the first test easy to understand and easy to stop.

1

Paper first

Run Bitcoin and stock ideas as simulations. Fable 5 researches and explains; we check whether the rules behave properly.

2

Use Coinbase Canada for the CAD \$10 crypto pilot

Coinbase Advanced supports API trading. Canadian users can fund with Interac or EFT and can cash out CAD to PayPal when the option is available on their account.

3

Keep stocks in paper mode first

Interactive Brokers Canada is the suggested research/paper connection. Live stock automation comes later because API permissions vary and CAD \$10 is too small for a meaningful stock pilot.

4

Unlock bounded automation later

Only after the paper and \$10 tests: a daily cap, asset allowlist, stop-loss rule, cooldown after losses, and one instant stop button.

How approval works

Only once - default

AI.EXE shows the full reason and order preview. Nothing happens until you accept that exact trade.

Always trade - optional later

AI.EXE may act without another click, but only inside the amount, assets, hours, and loss limits you approved.

How it learns from a loss

It records the setup, reason, timing, fees, result, and what changed. The next proposal must show how that lesson affected the decision.

It never promises the same mistake cannot happen again, and it never increases risk just to win money back. After losses, it reduces size, pauses, or asks you.

What we still need from you

- Your Canadian province and confirmation that this remains a personal tool.

- Your preferred starting mode: Only once is recommended.

- A linked Canadian bank/Interac method and PayPal account in the same legal name.

- A verified Coinbase Canada account, then a trade-only API key - never a withdrawal-enabled key.

- Your simple limits: CAD \$10 total, allowed coins, and the maximum loss before AI.EXE stops.

- Later: an Interactive Brokers Canada paper account if you want stock simulations inside AI.EXE.

Suggested first decision

Approve a two-week paper test in Only once mode. If the explanations and controls look right, connect Coinbase and run one CAD \$10 Bitcoin trade with a fee preview. Review the result before enabling anything else.
